if this function returns non 0 value, it will be wrong an application
if this function returns non 0 value, it will be wrong an application
to use the virtual file system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mount Virtual File System
The Virtual File System should exists the same directory of the App
If the Virtual File System does not exist in there,
this function will fail and exit application.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1f((fp = cfs_open(*windows.data*,CO_RDONLY)) == NULL)

This Function make Dirive from src path to dat path.
If src path and dat path is different drive, this function will due to Easy_Elgy aklue.
If Easy_Elgy at 1, this function will make the same drive from src to dat.
If Easy_Elg is 0, this function will do nothing.

MICROSOFT FOUNDATION CLASS LIBRARY : dynaplay

AppWizard has created this dynaplay DLL for you. This DLL n ot only

demonstrates the basics of using the Microsoft Foundation classes but

is also a starting point for writing your DLL.

This file contains a summary of what you will find in each of the files that make up your dynaplay DLL.

dynaplay.cpp

This is the main DLL source file that contains the definition of

DllMain().

dynaplay.rc

This is a listing of all of the Microsoft Windows resour ces that the

program uses. It includes the icons, bitmaps, and curso rs that are stored

in the RES subdirectory. This file can be directly edit ed in Microsoft

Developer Studio.

res\dynaplay.rc2

This file contains resources that are not edited by Microsoft

Developer Studio. You should place all resources no t editable by the resource editor in this file.

dynaplay.def

This file contains information about the DLL that must be

provided to run with Microsoft Windows. It defines para meters

such as the name and description of the DLL. It also exports

46 ReadMe

functions from the DLL.

dynaplay.clw This file contains information used by ClassWizard to ed it existing classes or add new classes. ClassWizard also uses this file to store information needed to create and edit message maps and d ialog data maps and to create prototype member functions. Other standard files: StdAfx.h, StdAfx.cpp These files are used to build a precompiled header (PCH) named dynaplay.pch and a precompiled types file named St dAfx.obj. Resource.h This is the standard header file, which defines new reso urce IDs. Microsoft Developer Studio reads and updates this file. Other notes: AppWizard uses "TODO:" to indicate parts of the source code

you should add to or customize.

DynaPlay SDK README FILE DynaPlay SDK Version 0.20 (C) Copyright 1996, 1997 SegaSoft All rights reserved.

Configuration instructions for using DynaPlay with Microsoft Developer's Studio.

IMPORTANT NOTE!:

Currently the DynaPlay SDK is only configured to support Microsoft Developer's Studio versions 4.x with the exception of version 4.0 under NT. Release 5.0 is **NOT** supported at this time. Furthermore, the DynaPlay SDK will **NOT** work with version 5.0 at this time. Furthermore, it's Microsoft's fault, not mine, at this time.

ALSO NOTE:

An example for the following instructions exists in the DynaPlay SDK. Refer to the Hangman32 workspace provided in

c:\Program Files\DynaPlay\Examples\Hangman32

(or wherever you installed the SDK) as an example of how to set up a DynaPlay workspace. Only steps 1 and 9 need be performed in order to build and execute this example.

In order to use the DynaPlay SDK with Developer's Studio versions 4.x, the following steps must be taken after the DynaPlay SDK has been successfully installed:

1. Make sure the DynaPlay executables and libraries are in the Developer's Studio search path. Add these directories (typically, c:\Program Files\DynaPlay\bin and c:\Program Files\DynaPlay\lib) to your executable and library search paths by calling up the Tools Options window and clicking on the Directories option. Add

c:\Program Files\DynaPlay\bin

(or wherever you installed the SDK) under executable files and

c:\Program Files\DynaPlay\lib

(or wherever you installed the SDK) under library files.

Note: Check to see if the file

dynalib.dll

was installed in your Windows system directory (usually \Windows\System

for Windows95 and \Winnt\System32 for NT). If you do not have write access to this directory, dynalib.dll will be installed in

c:\Program Files\DynaPlay\bin

(or wherever you installed the SDK). This will allow you to build your applications from within Developer's Studio but if you wish to execute them you must make sure that dynalib.dll is placed in a directory that is included in your **PATH** environment variable.

2. Create the DynaPlay build configurations for your existing project. These configurations must be named

DynaDebug

and

DynaRelease

Create these by invoking the Build Configurations menu option and selecting Add. Use the configuration settings for your Debug configuration in creating the DynaDebug configuration and similarly use the configuration settings for your Release configuration in creating the DynaRelease configuration.

- 3. After the new configurations have been created, call up the Build Settings window and click on the DynaDebug configuration. Hold the Ctrl key down while clicking on the DynaRelease configuration so that both configurations are selected. Now any modifications you make to the build settings will apply to both configurations.
- 4. Under the General category for Build Settings, make sure that the option

Use MFC in a shared DLL

is selected. This is necessary for all MFC based DynaPlay applications and has no effect if your application is not MFC based.

5. Under the C/C++ category select Optimizations. For the In-line function expansion setting, choose

Disable *

This is not absolutely necessary but is highly recommended until you have gained enough experience with DynaPlay to know how much trouble you can get into by not selecting this option.

6. Under the Link category select General. For the option Object/library modules, add the following:

dynatab.obj dynaplay.exp dynalib.lib

Also, make sure the

Generate mapfile

option is selected and that the

Link Incrementally

option is turned off, otherwise you will get an annoying warning message every time you build since incremental linking is incompatible with map generation.

7. Call up the Custom Build category and under Build command(s), add the following line:

Dynamize "\$(OutDir)" "\$(InputName)" "\$(WkspName)" "\$(TargetPath)" "\$(WkspDir)" "\$(IntDir)" DynaReleas

You might try cutting and pasting the line above to make sure you get it right. For the Output file(s) section, add the following:

\$(WkspDir)\DynaRelease.def

NOTE:

If you can see the difference between the workspace name and the project name, you will have to use the project name instead of "\$(InputName)". "\$(InputName)" represents the workspace name. The project name is shown in the project workspace window.

For example, the workspace name is "Test" and the project name is "test" the following:

Dynamize "\$(OutDir)" "test" "\$(WkspName)" "\$(TargetPath)" "\$(WkspDir)" "\$(IntDir)" DynaRelease

8. Now click on the DynaDebug configuration so that only it is selected. Change the Custom Build information for this configuration so that all references to DynaRelease are changed to DynaDebug. The resulting lines should look like:

Dynamize "\$(OutDir)" "\$(InputName)" "\$(WkspName)" "\$(TargetPath)" "\$(WkspDir)" "\$(IntDir)" DynaDebug

to the Build command(s) section and

\$(WkspDir)\DynaDebug.def

to the Output file(s) section. Finally, in the Link Project Options section, add the following option:

/opt:noref

Make sure that you scroll down to the bottom of the Project Options before entering the above option since Developer's Studio is likely to misinterpret how this option is to be parsed otherwise.

NOTE:

If you can see the difference between the workspace name and the project name, you will have to use the project name instead of "\$(InputName)". "\$(InputName)" represents the workspace name. The project name is shown in the project workspace window.

For example, the workspace name is "Test" and the project name is "test" the following:

Dynamize "\$(OutDir)" "test" "\$(WkspName)" "\$(TargetPath)" "\$(WkspDir)" "\$(IntDir)" DynaDebug

9. Build and execute the application in both the DynaDebug and DynaRelease configuration to make sure that everything is configured correctly. If so, you have now successfully built an application that has been "Dynamized" and is now ready to accept DynaPlay modules. Of note is the fact that you have accomplished this without making any modifications to the existing source code for the application. You are now ready to create the modules that DynaPlay uses to modify your existing application. These modules can be applied both at application startup and dynamically during the runtime of the application to modify the behavior of the application in any manner the programmer chooses. Not only can these modifications be performed dynamically (hence, the name DynaPlay) but these modifications require no forethought, that is, they can be made to the application after it has been created and distributed without prior planning as to the nature of these changes. The next section will discuss how to create the modules that DynaPlay ready applications use.

NOTE:

Do not change **Intermediate files** and **Output files** under the General category for Build Settings.

Creating modules for use with DynaPlay ready applications

At present, the responsibility for maintaining the source code used in the **Dynamodules**, rests with the user. This can be accomplished in a number of different ways, depending upon the nature of the application being developed. The Hangman example provided with the SDK shows separate directories, **dyna_include** and **dyna_c** for holding the source code used in the **Dynamodule**. This approach allows complete freedom to modify the application in any way, including header file modifications, without affecting the source code for the original application. This could be accomplished in other ways, such as using Visual SourceSafe to keep track of different versions of the code or the user may simply decide to modify the original code itself. At present, the choice of which method to use is up to the user. Keep in mind the following requirements when making your decision:

- The source code contained in the **Dynamodule** consists of only the changes you
 wish to make to the original application. Only those functions that are modified
 are included in the **Dynamodule**.
- 2. The filenames of the **Dynamodule** source code must have the same names as the filenames in the original application. For example, if you modify function x() in file a.c and function y() in file b.c, your **Dynamodule** will consist of code from two files, a.c and b.c. a.c will contain only function x() and b.c will contain only function y(). You cannot combine both functions into one file and call it, for example, c.c(or a.c or b.c for that matter).

Once the decision has been made as to how the **Dynamodule** source code will be maintained, the procedure for creating a **Dynamodule** project in Developer Studio is a follows:

- 1. Open the workspace that includes the original application.
- 2 Select the menu option Insert Project and choose to create either a Dynamic-Link Library or an MFC AppWizard(dll) depending on whether or not your application is an MFC application. Create this dll as a Top level project. You may name it anything you wish.

Note: If using MFC AppWizard(dll) to create the Dynamodule, you must select the MFC extension dll (using shared MFC DLL) option during the creation process.

- 3. If you have created an MFC Dynamodule, you must replace the "resource.h" file created by the AppWizard for the Dynamodule with the "resource.h" file used by the application. Use Windows Explorer to copy "resource.h" from the project directory of the application to the project directory of the Dynamodule, replying yes when asked if you wish to replace the existing file.
- 4. Select the menu option **Build Subprojects**. For the **Dynamodule** project you just created, include the original application as a subproject. This will insure that if the original application changes in any way that it will be rebuilt before the **Dynamodule** is built.
- 5. Select the **Build Configurations** menu option and, as you did with the original application, create two new configurations, **DynaDebug** and **DynaRelease**.
- Include two files that were created when the original application was Dynamized, DynaDebug.lib and DynaRelease.lib. They should reside in the root directory of this project's workspace.
- 7. Transfer any pertinent Build Settings from the original application to the Dynamodule. With both the DynaDebug and DynaRelease configurations selected, make sure the following options are set:
 - a. Under the General category, make sure that Use MFC in a Shared DII is selected, if this is an MFC application. This is necessary even though the Dynamodule was created as a non-MFC dII.
 - b. Under the C/C++ optimizations category, make sure that In-line function expansion is set to Disable *.
 - c. Under the Link General category, make sure that Generate mapfile is selected.
- 8. Select just the DynaRelease build setting and set the following options:
 - a. Under the Link Project Options add the following:

/opt:noref

just as you did for the DynaRelease configuration of the original application.

b. Under the Custom Build category, add the following Build command:

Dynamod "\$(OutDir)" "\$(InputName)" "\$(WkspName)" "\$(WkspDir)" "\$(IntDir)" DynaRelease

As with the original application, you may find cutting and pasting to be useful here.

c. For the Output file(s) enter the following:

\$(OutDir)\\$(InputName).def

- 9. Select just the **DynaDebug** build setting and set the following options:
 - a. Under the Custom Build category, add the following Build command:

Dynamod "\$(OutDir)" "\$(InputName)" "\$(WkspName)" "\$(WkspDir)" "\$(IntDir)" DynaDebug

b. For the Output file(s) enter the following:

\$(OutDir)\\$(InputName).def

- Select the Build Settings for DynaDebug.lib under the DynaRelease configuration and set the following:
 - Under the General category, make sure the Exclude file from build option is selected.
- 11. Select the Build Settings for **DynaRelease.lib** under the **DynaDebug** configuration and set the following:
 - Under the General category, make sure the Exclude file from build option is selected.
- 12. Include the source files into the project that you wish to modify. Remember, include only those files that contain modifications to the original application or the dll will be unnecessarily large. Also remember that any files included in the project should contain only those functions that are modified for the same reason.

Note: MFC Dynamodules can still use Class Wizard, however, you must copy, exactly, the constructor function, the AFX_DATA_MAP and the AFX_MSG_MAP of the object and then manually add the object to the Class Wizard database. Refer to the example in the SDK for details.

- 13. New resources may be added to MFC Dynamodules as you would normally add them to the application. No additional code is required to manage their use. You may also modify existing resources by drag and dropping them from the application into the Dynamodule and then editing them. No additional code is required. Also, compound resources, such as dialog boxes that include icons, need not include those resources that will not be modified. This is a new feature, available only with DynaPlay, that eliminates the need for redundant resources in the Dynamodule resulting in a much smaller dll than is typically capable using traditional programming methods. Refer to the About box in the Hangman application for an example of how this can be used.
- 14. Build the application.

Note: The first time you try and build an MFC Dynamodule, you will be asked if you wish to overwrite the existing "resource.h" file. This is due to having copied the application's "resource.h" file in step 3. Answer yes to this question. You will not be asked again.

15. Select the Execute option. When prompted, enter the relative path name of the original application that was built for this Dynamodule. Remember that the DynaDebug version of the original application only works with DynaDebug versions of the Dynamodules and that the same holds true for the DynaRelease version of the original application with respect to the DynaRelease versions of any Dynamodules created.

The application should now execute with the code created in the **Dynamodule** substituted in place of the code created in the original application. Executing the Hangman32 example provided in the SDK demonstrates this.

```
Following commands You can Modify
 # * If you want to modify commands, you have to take
    out ';' at first line.
 # * The root of a terget path is the directory where
     is an application in user environment.
 # * /initscb is a control script that represents before
     before /initsc. /initsca means a control script that
     represents after /initsc.
  # * /initscb + /initsc + /initsca is a control script for#
     DynaModule. The control script saves XXX.dat
                       is a dependent modules which is
 # * /dependent:
     used by this DynaModule.
 # * /eval: is the evaluating script in a DynaInstall.exe #
# * Use '\' and CR to continure a line #
 ;/scinitb: ControlScript_brefore_'initsc'
;/scinita: ControlScript_after_'initsc'
;/dependent:module_name1,module_name2,...
;/eval:ControlScript
;/vfs:Source_path|Target_path_in_VFS
;/vfsdata:Value|Target_path_in_VFS
/data:C:\Program Files\Net
Fighter\DynaModules\DynaModule1\DynaRelease\dynamodule1.dll|selfandheat\dynamo
dule1.dll
/data:C:\Program Files\Net
Fighter\DynaModules\DynaModule2\DynaRelease\dynamodule2.dll|selfandheat/dynamo
dule2.dll
/out:c:\temp\aaa.dyp
